OmniView4DOM

Provided by Rasta-man aka Juke Master

1. Description

OmniView4DOM project started as a need for cup games in Passionate Gaming discord channel as no one from UT community step up and do one so , i start to give it a try This OV4DOM replaces the standard UT99 HUD with a broadcasting-friendly one for streaming 4V4 Domination games ,NW and also IG+.With my work i tried to have on the screen all information necessary for streamers and spectators to have an instant view who is the dominant team,how much total points has any player from the teams and the most important ,i think,what player is dominating what point aka DOMINATOR MACHINES.

2. Main Features

- Score, remaining game time and teams points displayed top centre.
- User selectable team names, maps picks, live score, progress bars, etc will be explained later in document
- Chat and quick console top left with separate kill feed top right and user-changeable font size.
- In-built shorter and easier readable kill feed messages (user selectable and customizable).
- User selectable on-screen score board featuring two colour schemes on the left with highlighting of the spectated player as well as total points and points taken on every dominating point.
- User selectable on-screen item timer for user-selected power-ups.
- Health and armour displayed bottom centre with dynamic icons and optical clue for low health and additional display of spectated player’s name and weapon (user selectable).
- Possibility to directly switch from first person view to 3rd person view (user selectable).
- Working player numbers for easy switching using the game’s native Num Pad key-binds.
- In-game menu for real-time changes to the settings while a game is running.

3. Usage

3.1 Requirements

OmniView4DOM is made for and tested with Unreal Tournament 469e running in full screen.
OmniView4DOM was made for an in-game resolution of 1920x1080. Other resolutions, especially stretched ones, might not work optimally.

The tool is meant for online use. The following must be running on the server for full functionality:

- To display the on-screen score board correctly, SmarterUTv0_1d is required.
- To display the progress bars near the point names on domination, the server must run also the mutator DomHudOverlay made also by me and can be found in my Github page.
- IG+ is needed to display the armor amount
- To show accuracy information, UTStats is required (tested with UTSAccuBeta4_2).

3.2 Installation and starting

Copy the .u-, .int- and .ini-files in your game's \System folder. After doing so, you can start the tool from the game's menu. Keep in mind that it needs to be restarted each time the map is changed.

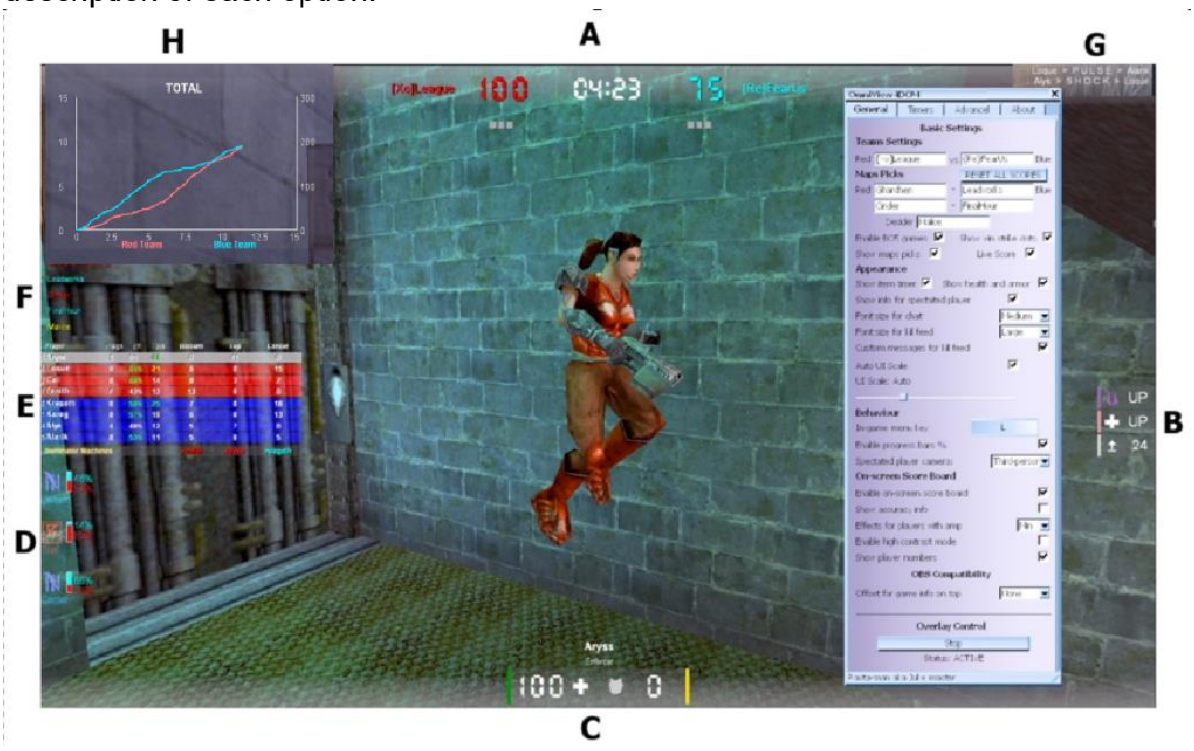

3.3 Settings

a) General remarks

For some of the settings to be accessible in game, OmniView4DOM needs to be running.
The settings are stored in OV4DOM.ini in your game's \System folder and can also be changed there.
The size of the game information score, clock, maps picks on top and the player status at the bottom can be adjusted be changing the UI size in the OV4DOM page settings.
The on-screen scoreboard on the right won't be affected by this though. It changes size automatically depending on the resolution the game is run at.
The progress bars from DomHudOverlay are made for 0.4 HUD Scale in game set in user.ini and should be scalable for any other Hud scale.

b) Overview of settings

On the next page you can find an overview of the HUD followed by a brief description of each option.

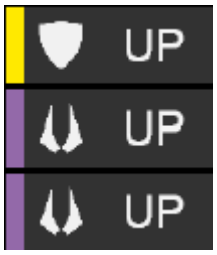

A- Show Teams Name on Top, total domination points and win strike dots depending on BO3/BO5 system
The name of teams currently playing are displayed on top. Also the remaining time clock that was redesigned to be scalable with the names and score

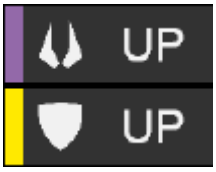

Under the teams points scores you will see a WIN STRIKE DOTS that will show the maps won by each team based on maps picks
In this image the red team won one map and the blue team won one map.
The game shows 3 dots because the B05-Best of 5 games system is enabled
Is related to maps picks that will be described later in this document.

B- Show Item Timer (bShowItemTimer) | "On" by default
If selected, an on-screen item timer for amp(s) and belt(s) will be displayed on the right. If there's more than one item of the same kind present, the icons will be coloured in the colour of the team's base the item is closer to. If the game has not yet started (warm up), all item icons are neutrally white coloured.

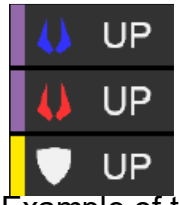

Example of the item timer during warm up with 2 amps and 1 belt.

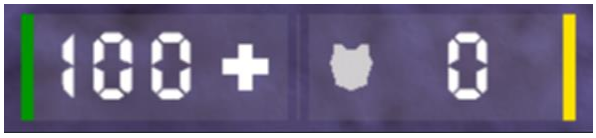

Example of the item timer after game started with 1 amp and 1 belt

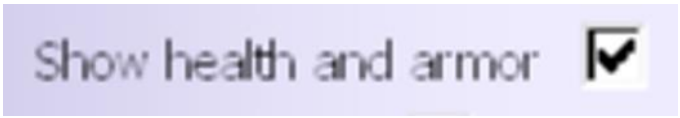

Example of the item timer after game started with 2 amps and 1 belt

C- Show Health and Armor (bShowHealthArmor) | "On" by default
If set to on, health and armour of the spectated player are displayed bottom center. The icons are dynamically filled according to health and armour amount. If the

spectated player's health drops below 50, there will be a visual hint. If the spectated player has the belt, armour amount will be drawn in yellow.

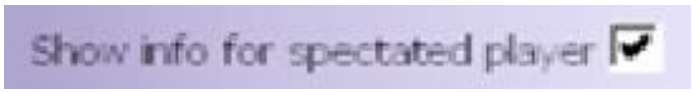

-Show info for spectated player (bSpectatedPlayerInfo) | "On" by default

If is set to on,player name and the weapons in hand will be shown bottom center above the health and armour icons

D-Progress bars | "On" by default

The idea of these progress bars started from Decl that wanted ,as a player, to have some information for quick view of the domination points ,what team is dominating more the point so the captain can switch something middle game. Because this option requires DomHudOverlay mutator to be installed on server, will work only in that situation. If the mutator is not installed, the domination points will be shown only like domination style

The precents % will be always 99% as a sum because from the start of the game you need some seconds until you touch one point so can not be 100%

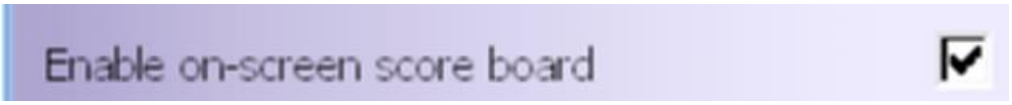

I also added a shadow function to the red colour percentage as is hard sometimes to see it on some maps.

For easy see you just can watch the blue percentage and subtract the value from 99% or 100%

The option is selectable by user if you want to show it or not during game

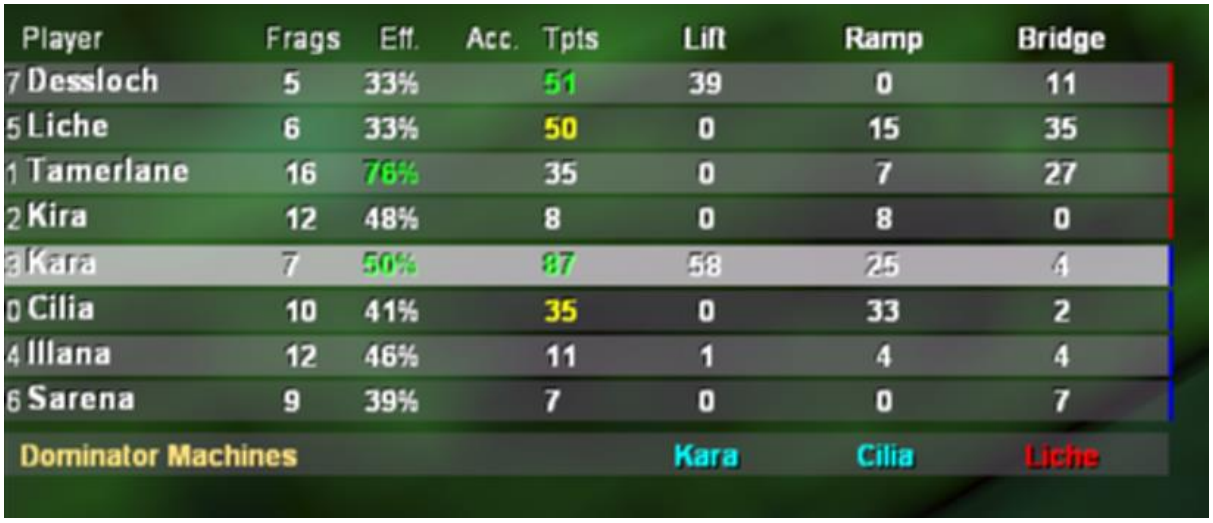

E-Enable On-Screen Score Board (bScoreBoardState) | “On” by default

If selected, an on-screen score board will be displayed on the left side. Frags, Efficiency, Accuracy, Tpts.-Total Dom Points grabbed by a player and the 3 domination points names that will show for every player how much domination points they have in any of these 3 points. The list is sorted by player total points for each team. The best player from each team that have the maximum points for his team grabbed from all 3 points will be visible in the Tpts column with colour green and the second-best player from each team will be visible with yellow colour. The other 2 players that have less points will be just grey
The efficiency column will show the players with efficiency over 50% with green and the accuracy over 40% also with green so you can see also easily what the efficiency and accuracy of a player in real time is

Show Accuracy Info (bShowAccuracy) | “Off” by default
If set to on, additional accuracy information will be displayed between the efficiency and the Tpts column.

Show Suicide info (bShowSuicide) | “Off” by default
If it set, will show a suicide info column after the Kills

The last but not the least of the information i tried to bring on this overlay is to show the best player that dominates a point aka DOMINATOR MACHINES
You will see on the bottom of the scoreboard the names of the players and the colour of his team. These players have the most points grabbed on one of these 3 points

In the example image KARA has 58 points on Lift and Dessloch has only 38 so KARA is the dominant player for the Lift point for blue team

For red team Liche has 35 points on bridge point and is the dominant machine because no one from blue team has more points on bridge

I also have implemented a function that will clean the team tags players names from the special characters like /[ ] \ { } - = etc.This is need it as the names that appears on dominator machines will be more visible to the streamer and will be also shorter.
The player names on this game are:

F-Maps picks and Live scores | "On" by default

The maps pick system came also from some streamers requested to show during game as some spectators are connecting and ask all the time what maps these teams will play during this session so i decided that is a good idea to be visible also in game on the left side

In a BO5 game session you can set up 2 maps for red team,2 maps for blue team and one map for the decider map. The maps names will be coloured with team colour, and the decider map will be coloured with yellow.

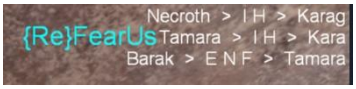

Also will be visible the live scores on the right side of the maps names that can be disabled by user

G- Larger Font for Chat / Kill Feed (iFontSizeChat & iFontSizeKF) | "Medium" by default

This option lets you change the font size for chat (top left) and/or kill feed (top right) for better readability on stream. [Small] equals the game's standard font size, while [Medium] and [Large] increase it a bit each.

Custom Messages for Kill Feed (bMsgLengthKF) | "On" by default

If this option is selected, the standard death messages are replaced by easier readable ones. The messages can be customized in the "Advanced" tab. The reset button in the "Advanced" tab will reset the messages to the defaults of OmniView4DOM, not the game's defaults. If you want to display the default messages of the game (again), just de-select the option all together. If you want to change the messages, you can also do that by editing OV4DOM.ini, which is probably the quicker and easier way. Natively supported by the game are "%k" for the killer's name, "%o" for the victim's name and "%w" for the used weapon.

Customisation -from the OV4DOM tab menu

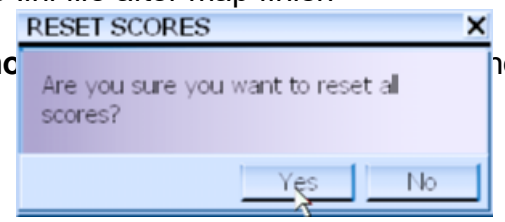

1. **Teams setting** names in game, you Can set up the team names left and right side of the domination points

2. **Maps Picks**-in the cup games layout you can set up the maps names that were picked by every team to be shown during session above the score board.
   Reset all scores-this option let you reset All scores that were saved for every map. This option works BEFORE connecting to a server.A dialog box for confirmation will be displayed when press RESET.

3. These settings are all related:
   -Enable B05 game-will show 3 maps or 5 maps picking system

   -**Show win strike dots**-will show under the domination points to see the status of maps won by each team.

   Live score-on the right side of the maps names you can show live score that is the same as the top one. This system is used for helping on saving scores in the .ini file after map finish

Sho how the

Show performance graph-you can hide or show the performance teams graphic during game like in the UTSTATS web page.

Points score-showing the scores on every point under the main total points score

4. **Show item timer**-on the right side of the screen will be shown the timers for items like ,armour,damage,belt,etc.

   Show health and armor-on the bottom center of the screen will be visible the health and armour amount for spectated player.

   Show info for spectate player-on the bottom center of the screen will be shown the player name and weapon in hand

Movie style-when is on will add a gradient on top and bottom side of the screen creating a movie style appearance.

Font size for chat-user can set the font size for chat messages. Options are :small, medium, large

Font size for kill feed-user can select the font size of kill feed messages. Options are: small, medium, large

Custom messages for kill feed-when is on will show the kill messages on top right corner of the screen.

5. **Auto UI scaling-**

This option can be used for bigger resolution to scale some information from the Hud. Can be scalable the following: teams names, domination scores points,win strike dots and clock(timer) from the top centre. Also will be scaled the maps picks names, the information of spectated player ,the player's name and weapon in hand and the kill feed messages and chat messages
If it is set to auto scaling all the information will be scaled with the resolution of the user.

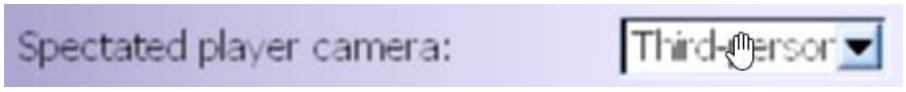

6. **Behaviour**

In game menu key -this can set up for user a quick key bind to access the tab during game

Enable progress bars-when is on will show the progress bars near the domination points icons

Spectated player camera-user can set how a player is spectated. Options are: first person camera view or 3rd person camera view.

7. **On-screen score board**

Enable on screen score board-when is on the scoreboard will be visible on the Hud

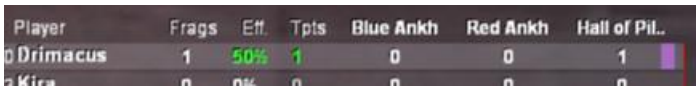

Show accuracy info-when is on the accuracy column will be visible between frags column and Tpts column

Show suicide info-i implemented the suicide info and use it to calculate the real kills of a player as the Smarter dom mutator show the total kills a s asum of the frags and suicides and that were not the real frags.

Effect for players with amp- This option determines how a player carrying the amp will be highlighted in the on-screen score board. [None] doesn't show anything. [Min] shows a small rectangle behind the score of the player. [Max] colors the amped player's row differently. The colorization decreases roughly according to the time of amp usage left.

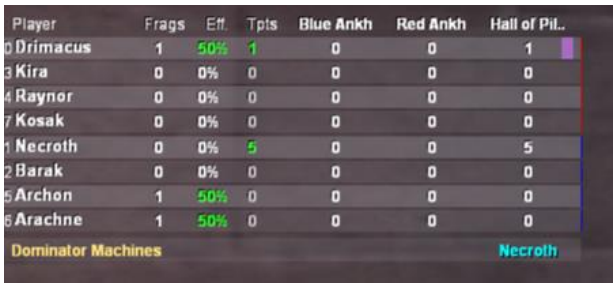

Enable high contrast mode-when is enabled will show the score board without the teams colours

Player	Frags	Eff.	Tpts	Blue Ankh	Red Ankh	Hall of Pil..
Drimacus	6	66%	14	11	0	2
Kira	3	37%	11	0	1	9
Kosak	1	33%	5	0	0	4
Raynor	1	20%	4	4	0	0
Archon	3	60%	22	0	22	0
Barak	1	20%	17	6	0	11
Necroth	4	57%	15	6	0	8
Arachne	4	44%	0	0	0	0

Dominator Machines — Drimacus — Archon — Barak

Player	Frags	Eff.	Tpts	Blue Ankh	Red Ankh	Hall of Pil..
Drimacus	1	50%	1	0	0	1
Kira	0	0%	0	0	0	0
Raynor	0	0%	0	0	0	0
Kosak	0	0%	0	0	0	0
Necroth	0	0%	5	0	0	5
Barak	0	0%	0	0	0	0
Archon	1	50%	0	0	0	0
Arachne	1	50%	0	0	0	0

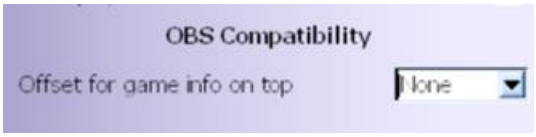

Dominator Machines — Necroth

Show players numbers (bPlayerNumbers) | “On” by default

If selected, the player’s numbers will be shown left of their name. Those numbers support changing the view by the corresponding Num Pad keys as originally featured by the game out of the box. If you’ve deleted those default key binds from your User.ini, just add “ViewPlayerNum [#]” again (“NumPad0=ViewPlayerNum 0” etc.).

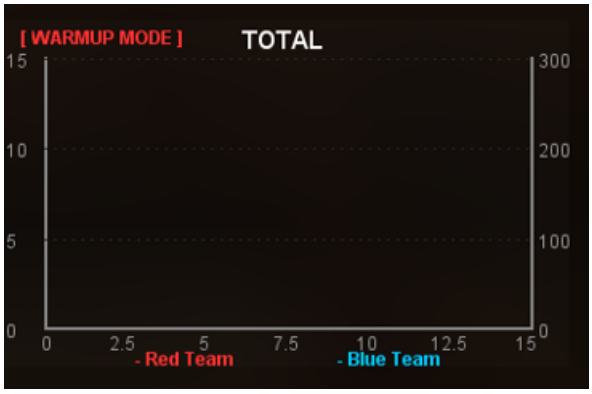

8. (Advanced) Offset for game info on top (iOBSOffset) | “None” by default

This option lets you select an additional vertical offset from the top for the game information (score, clock and so on) on top so you can show a banner or something in you broadcasting software there. [None] doesn’t create any additional offset, while [Small] creates a 25-pixel offset, [Medium] at 50-pixel offset and [Large] a 75-pixel offset, for a resolution of 2560x1440. The offset will be reduced to keep the same ratio of your resolution is lower.

H-Drawing teams performance chart | “On” by default

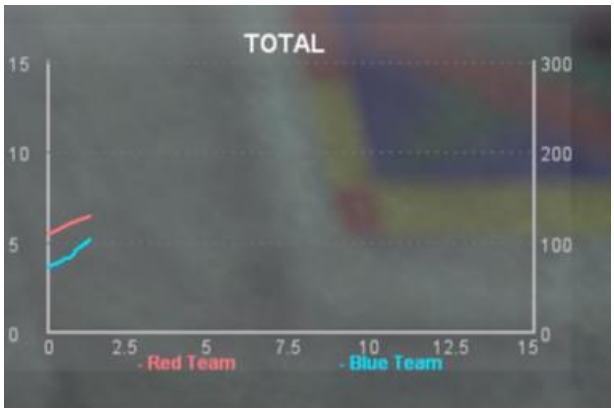

Before the game is starting,as spectator with the mode enabled ,the performance chart will display that the game is not started and is in warm up mode

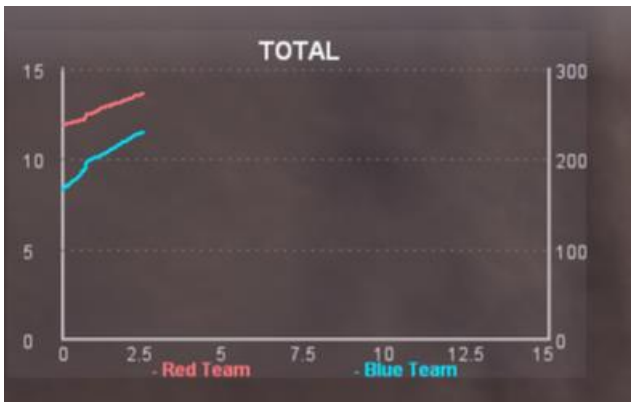

During the game the chart will display with 2 lines,one red line and one blue line ,the performance of the teams controlling the points.This function i inserted on request as if any spectator watching the stream connects in the middle of the stream will see how the teams were performing from the beginning of the game.

If the streamer crashes and needs to reload the game,the informations until that point will not be stored anywhere and after he starts the overlay again,the performance chart will start displaying during that moment and will look like this.

4 Known Limitations and Issues

4.1 General remarks

•The tool works best with an in-game resolution of 1920x1080 (see above). It was tested using XOpenGL and D3D9/D3D11. Compatibility with other renderers is probable but not guaranteed.

• SmarterUTv0_1d (for the on-screen score board), IG+ (to display the armor amount) and UTStats (for accuracy information) required for full functionality (see above as to why).

•Since OmniView4DOM replaces the default HUD, it will rightfully be flagged by anti-cheat. Only use it as a spectator broadcasting a game and make sure the server's anti-cheat is set to not check spectators.

•OmniView4DOM is made for 4v4 DOM supporting both NW and IG. You will almost certainly run into issues with more than 8 players or with a unsupported game mode.

•Since there are many mods for UT, compatibility can be questionable and is not guaranteed. This also applies if you are using tweaks, especially the ones tampering with textures.

4.2 Specific remarks

•Can very rarely crash the game when the map is switched or on exiting the game while the tool is running.

•Armor amount after a player picks up an armor or changes to the armor amount after the viewed player took damage don't displayed instantly as this info is only updated once every second by IG+. Therefore, kindly refrain from conducting any in-depth analysis based on the displayed values.

•"ViewPlayerNum 0" rarely not working in warm up mode.

•Don't use offline

Please keep in mind that I'm not really a programmer and even less a u-scripter so therefore other limitations I'm unaware of may apply.

5 Version History

1.0 (14th May 2026) Initial public release.

6 Acknowledgments

Inspired by OV4CTF and OV4TDM by Waylander.

Most of the code remains the same, untouched, i only build the domination system by replacing the CTF and TDM system.

Credits to ANUSHUNTER5000,Waylander, Gamertomthebomb and all Passionate Gaming streamers for helping with the HUD setup ♥

Also, thanks to anybody who ever bothered writing a tutorial for, a guide about or a documentation regarding u-script.

Finally, thanks to everybody in PG-Passionate Gaming for letting me spectate a few games and allowing me to use the test server.
